## HEAT RECOVERY FUNDING

### UK Government Funding Support

Improving energy efficiency will be key for achieving the Governments Industrial Strategy's aims of reducing business energy costs, improving industrial productivity and competitiveness, and driving clean economic growth.

The recovery of waste heat from industrial processes is an energy efficiency measure that can immediately deliver all of these things, by reducing fuel requirements and helping industry avoid energy waste. The associated reduction in carbon emissions will also help the UK meet its legally binding Carbon Budgets.

BEIS commissioned an independent study into the available heat within the industrial sector and found that the available level was 11 TWh/year but that only some 45% of this heat source could be captured in a commercially viable way.

This new programme funding is targeted to provide financial support, delivered through competitive grant funding, to projects that have additional financial barriers to overcome.

BEIS have announced a two phased approach to the new round of heat recovery project support. £6 million will be available in Phase one to provide support for feasibility studies with Phase two providing £12 million support for delivery through competitive grant fund.

**Please take this opportunity to move on a possible project by giving us a call to get things started.**

## IN THIS ISSUE

### HEAT RECOVERY FUNDING

Details of available funding pending

BEIS announce competitive grant funding to overcome financial barriers for business.

*"The new scheme will help us to develop viable reforms to make the most of the heat we produce and use it effectively to bring bills down for businesses across the country"*

Baroness Neville-Rolfe,  
Minister of State for Energy,
